**Mobile Application Development - Change Brief**

Branch: Michael.Dev | Date: 12 Nov 2026

## Overview

Today the Michael.Dev branch wired the Flutter app to the live Node/Express + MySQL backend, added borrow day/payment/wallet support, and resolved PR merge conflicts with main. Main commit: 489d83b. Conflict-resolution merge: ea4829c.

## Backend

**- Borrow day fields**

Pickup date, planned return date, and rental day count are stored and validated against each asset return_before date.

**- Wallet + payment amounts**

Users have a wallet_balance. Paying for a borrow deducts deposit + rental total; confirming a return can refund deposit.

**- Asset owner APIs**

GET /api/assets/mine lists the logged-in owner items; PATCH /api/assets/:id updates lending details.

**- Lending list API**

GET /api/borrows/lending returns borrow requests for items the current user owns.

**- Wallet module**

New wallet routes/services for balance read and top-up, with Swagger docs.

**- API smoke test**

Added overall_api_test.mjs to exercise auth, assets, borrows, wallet, and payment flows.

## Frontend

**- API layer**

Added ApiClient, AuthSession/JWT handling, and Asset/Auth/Borrow/Wallet service wrappers.

**- Auth screens**

Login/register now call the real auth API and keep a session token for protected calls.

**- Home + item detail**

Home loads available assets from the API; item detail shows live asset data and starts a borrow flow.

**- Add / edit item**

Create and update assets with image upload, numeric price/deposit, pickup point, and lending end date.

**- Borrow request + payment**

Borrow flow calculates rental days within return_before, then payment charges the wallet.

**- My Borrowed / My Lending / Requests**

Lists, cancel/request-return, delete/edit owned items, and approve/confirm return actions use live APIs.

**- Wallet screen**

Shows balance and top-up; file renamed to wallet_view.dart to match main.

## Conflict resolution (PR)

Merged origin/main into Michael.Dev. Kept API-wired add/edit/lending controllers instead of local mock versions. Accepted wallet.dart -> wallet_view.dart rename while preserving the wired wallet UI. Updated unit tests to use fake AssetApi/WalletApi where needed. Related user-module tests passed (26).

## What this enables

## Mobile Application Development - Change Brief

Branch: Michael.Dev | Date: 12 Nov 2026

End-to-end borrow flow: browse items, request for N days, pay from wallet, manage borrowed/lending lists, and handle return confirmation - all against the real backend instead of mock UI data.
